

Extending tclpdf from outside

The blue band at the top of this page was not drawn by the script. It was drawn by a subscriber to the `pageAdded` event, which calls a method that this example added to the document class - neither of them known to the package itself.

```
page size, in mm = 210.0 297.0
coords 20 30 -> pt = 56.69 756.85
distance 20 mm -> pt = 56.69
extent {20 10} -> pt = 56.69 28.35
page size, in inches = 8.27 11.69
distance 1 in -> pt = 72.00
```

```
subscribers to pageAdded: 1, to beforeWrite: 2
after [off]: 0 - so the next page comes without the band
```

The second page, without the subscriber

The band is missing here because the subscription was cancelled before this page was added - not because this page was drawn any differently.
