

A striped TIFF under PDF/A-3B

PDF/A-3B, output intent sRGB.icc. The picture is the same scan as on the other pages: 30 image XObjects, every one of them a /FlateDecode stream, and DeviceGray, which every output intent admits (ISO 19005-2, 6.2.4.3). A TIFF whose strips are LZW arrives here as Flate too - the unpacking happens on the way in, because ISO 19005-3, 6.1.7.2 forbids /LZWDecode and a stream already written cannot be repaired.
